### TMI ATC

[\(/home\)](https://www.asminternational.org/about/tmi-atc)[TMI ATC](https://www.asminternational.org/tmi-atc)[\(/home\)](https://www.asminternational.org/tmi-atc)

production-related environment – an application requiring high precision along with a maximum degree of automation in handling extensive test programs.

Designed for operation by mouse or touchscreen, the system offers expert users the required flexibility and broad feature set for planning, running, analyzing, documenting and archiving of individual measurements and measurement series, while at the same time enabling less extensively trained operators to work quickly and efficiently.

DiaMet is optimized for evaluating Macro-Vickers, Micro-Vickers, Knoop, and Brinell indents according to ISO 6507, ISO 4545, ASTM E384, ISO 6506 and ASTM E10. It is designed to work with all models of the current Wilson VH and UH hardness tester series, as well as some legacy systems.

As an international software package offered in multiple languages, the current Wilson DiaMet software addresses all relevant national and international hardness testing standards requirements.

"DiaMet users in global organizations can now share and compare results worldwide – regardless of where the measurements were made," says Marcel van Banning, Product Manager Hardness, Buehler ITW Test & Measurement GmbH. "With this new release, we are providing test engineers with a tool enabling them to supply detailed and reliable results, even when work assignments are time

sensitive. In addition, the high degree of automation enables even less trained staff to conduct comprehensive test series and produce highly accurate results."

The new design of the DiaMet testing software substantially facilitates the process of meeting ISO 9015 and ISO 15614 hardness testing of welds. The software guides the operator through the setup process by adapting a fixed test pattern to the sample in hand with only a few clicks – strictly in accordance with the standards. The software produces a graphical image of the complete weld, including indent positions and associated measurement values, which can be used in a test report.

ISO 9015 and ISO 15614 describe the test loads, number of indents in the parent material, heat affected zone (HAZ) , distances between each indent and the depth below the surface of the welded joint. Fulfilling these test requirements traditionally requires a time-consuming setup and an experienced operator, not least due to the fact that no two weld samples are completely identical. DiaMet saves time and improves accuracy.
