# Buehler meets short delivery times for materialography

16 December 2019

As a developer and manufacturer of complete system solutions for materialography and hardness testing, Buehler can meet short delivery times for the installation of fully equipped laboratories with perfectly matched equipment and consumables. The company is thus responding to the growing demand for innovative, intuitive and dependable equipment, for R&D as well as for quality monitoring in heat treatment, medical technology, electronics, automotive, aerospace, and other industries.

Buehler's range of systems available for short delivery includes the Wilson VH3100 (Vickers) and Wilson Rockwell 574 hardness testers and associated DiaMet software and, for materialography, also ranges from IsoMet high-speed precision cutters to SimpliMet 4000 mounting presses, AutoMet and EcoMet grinders and polishers and the Burst Dispensing Systems up to the OmniMet image analysis software. An experienced application engineering team can give customers the dedicated all-round support they need to choose the ideal configuration for their particular tasks.
